

HURST CREEK MUNICIPAL UTILITY DISTRICT
WATER CONSERVATION PLAN
FIVE- AND TEN-YEAR GOALS

INTRODUCTION AND BACKGROUND

Hurst Creek Municipal Utility District was created by the Texas Water Commission in 1979 to provide water and sewer services to approximately 700 acres in western Travis County, Texas. In 2005 the district also took over responsibility for storm water drainage which had previously been administered by the Property Owner's Association. As a political subdivision of the State of Texas, the District is retail, non-profit public utility with the rights, powers and responsibilities as outlined in Chapter 54 of the Texas Water Code.

In 2003 the Texas Legislature mandated the Texas Commission on Environmental Quality (TCEQ), the successor agency to the Texas Water Commission, to adopt rules requiring all public water utilities appropriating more than 1,000-acre feet of surface water to develop water conservation plans with five- and ten-year goals.

This document examines the District's water usage for the past five and ten years and proposes five- and ten-year goals for conservation.

CONTENTS

1. Description of the planning area

2. Distribution Map
3. 10 Year Water Accountability and Connection Summary
4. Leak Detection Program and Operator Assistance
5. Backwash Recovery Historical Data
6. Resolution Adopting Water Conservation Plan

DESCRIPTION OF THE PLANNING AREA

Hurst Creek MUD's primary service area is a residential subdivision, The Hills of Lakeway, originally platted in 1979 in the City of Austin's extraterritorial jurisdiction. The subdivision consists of approximately 1,042 single family lots, 158 condo lots, and a small commercial tract fronting Lohman's Crossing Road. The commercial tract is within the City of Lakeway and contains an office complex, an assisted living center and a skilled nursing center. A general location map and a detailed map of the water distribution system are attached as Appendix Items 1 and 2.

In 1997 the Village of The Hills, a municipality, has been incorporated within the original District boundaries. Additionally, The District has annexed some 34 acres to include the Emmaus Catholic Church and adjacent grounds.

The residential portion of the District is nearing build out, with less than 10 vacant single-family home (SFH) lots and 2 vacant condo lots remaining.

Most of the existing homes are moderately large, with the average appraised value of a homestead at \$1,004,875 in 2023, the most recent year available. Most homes are heavily landscaped and lawn sprinkler irrigation systems are required by the Property Owner Association Architectural Rules. There are five condominium regimes within the District, with an average of 15 units each.

Most streets within the District are privately owned by the Property Owners Association, and access is restricted by a system of computer-controlled traffic gates; only residents and their guests are capable of free ingress. A private security firm oversees the manned gate.

THE WATER SYSTEM

The District purchases raw water from the LCRA pursuant to a Water Sale Contract and Conveyance Agreement. The raw water is pumped through an 11,000-foot pipeline and treated by the District's three water treatment plants, each with a capacity of 1 MGD. Treated water is stored in two ground storage tanks of 150,000 gallons each, and a 500,000-gallon elevated tower.

A network of water mains ranging in size from 16" to 4" deliver treated water to the District's customers. The system map is included in Appendix 2.

All connections are metered, with meter sizes ranging from 3/4" to 6". Currently, about 99% of the district's meters are Metron AMR's with single jet technology.

The system is financed via ad valorem property taxes levied on all property within the District, and from service revenues. All facilities were designed by registered professional engineers, approved by the appropriate State agencies, and maintained by licensed operators.

HISTORICAL USAGE PATTERNS

Usage patterns for the previous ten years are shown on Appendix 3.

The data for the last ten years shows a slight increase in residential connection daily avg usage to an average of 567 GPD. This was primarily due to the moderate drought experienced during that time and the following couple of years. In 2022 when there were no watering restrictions and a lack of rainfall, the average usage went up only slightly to 653 gpd. With the implementation of water restrictions and customer education, it lowered to 594 GPD per connection in 2023.

When comparing GPD per connection entering the distribution system with the total raw water pumped from Lake Travis (source water), it is evident there has been a large reduction over the last 10 years. This has primarily been accomplished by the installation of the District's backwash water treatment facility. This will be discussed in greater detail later in this document.

Water accountability is excellent, ranging from 92.3% to 81.6%, with an average accountability of 88.6% over the last 10 years. This high accountability is the result of a wholesale change-out of all service lines in the system in the early 2000's and a rigorous water meter changeout program. In fact, the district experiences less than half a dozen system leaks per year as apposed to previously having as many as 2 to 3 leaks per week!

PROJECTED USAGE PATTERNS

With continual conservation efforts the district is expecting the average usage to level out and trend down.

IRRIGATION OF THE HILLS GOLF COURSE

Due to the legislative ban on wastewater discharges in the Highland Lakes region, golf course irrigation with wastewater effluent goes hand-in-glove with operation of a public water system. The District has a contract with the Hills Golf Course allowing for the disposal of treated wastewater effluent. Conversely, storage of wastewater effluent is essential for operation of the course during the hot, dry summer months, when area lakes are low, drinking water demand is high and the LCRA's water conservation plans may curtail the use of lake water on golf courses.

Hurst Creek MUD's irrigation infrastructure includes a 500,000 gallon per day wastewater treatment plant, a 210,000-gallon surge tank, a 12" diameter effluent force main, a 50-million-gallon effluent holding pond, and a sophisticated computer-controlled pumping and valving system. The actual irrigation distribution system belongs to the owner of the golf course.

The irrigation system provides for the application to the golf course of effluent stored in the 50 MG pond, or alternately, water from Hurst Creek may be used. However, state law forbids the introduction of the effluent into the creek. Effluent and creek irrigation volumes are separately accounted.

The contracts between the District and golf course stipulate that the District will pump water from Lake Travis, as part of its water sale contract with the LCRA, to maintain water levels in Hurst Creek. The golf course may take suction from the creek but must pay the District for the water withdrawn; in turn, the District must pay the LCRA for creek water used.

Effluent irrigation typically takes place at night, when the course is closed to play, and large volumes are applied – up to 1,800 gallons per minute – by a network of sprinkler stations spaced throughout the course.

To operate properly, an irrigation distribution system must always be kept pressurized, even when irrigation is not taking place. Additionally, landscape maintenance personnel use irrigation water during the day, but not in enough volumes to justify running the District's 250 hp effluent pumps. Because the golf course irrigation system is kept pressurized with water from Hurst Creek on a continuing basis, and effluent from the pond is supplied only during major irrigation cycles. This creek water must be replenished with Lake Travis water, purchased by the District from the LCRA. This lake water usage represents an opportunity for water conservation efforts.

HISTORICAL USAGE PATTERNS

Golf course irrigation demand, like drinking water, is highly weather dependent. A roughly constant flow of wastewater must be stored and apportioned onto the golf course so that the storage pond neither overflows nor goes dry. Over the past ten years golf course creek irrigation demand has ranged from about 4 MG during a wet year to 62 MG during a dry year. Average annual use from the creek appears to be around 30 MG. During the same 10-year period, golf course effluent irrigation ranged from around 23 MG during a wet year to almost 90 MG during a dry year. Average effluent irrigation demand appears to be around 53 MG per year. Refer to Appendix 3 for historical golf course irrigation data.

PROJECTED USAGE PATTERNS

As 100% of all wastewater effluent produced by the District must be irrigated on the golf course or adjacent landscaping, effluent disposal must be the guiding principle of reuse. Current wastewater production is around 200,000 gallons per day. Additionally, the District is contractually obligated to store and dispose of a maximum of 100,000 gallons per day of treated effluent from WCID#17's wastewater treatment plant. Total effluent production will exceed the average annual golf course irrigation demand of 246,575 gallons per day, and it is obvious that additional irrigatable areas will be required in the future. However, averages are somewhat meaningless. In a dry year there will not be enough effluent, and we will require water from Lake Travis to meet golf course demand; in a wet year we will be urging the golf course to irrigate more than their actual needs, to legally dispose of the necessary volume of effluent. To help alleviate an over abundance of effluent stored during a wet weather year, the District has modified it's 210 authorized reuse permit to include Lakeway MUD's disposal area and installed a 10" effluent line extension to be able to send effluent water to Lakeway MUD if needed.

PAST CONSERVATION EFFORTS

In May of 2015, the District purchased an AMR system from Metron Farnier. All meters and registers including all commercial and residential customers were changed. This significant upgrade took place over three months. Included in this system is an online portal both for the district and the customers. It is web based and has phone apps for Android and Apple, along with the ability to provide push notifications. The meters report daily their total usage and gallons per minute (gpm) for every 5 minutes! With this

amount of detail, it is possible to detect many different types of leaks and report them. Built into the system is a customizable alert system for both the District and the customers. In conjunction with the installation of the AMR system the District implemented a customer leak notification program. This is in addition to the automated system called Waterscope. The District's personnel receive a master leak email daily and through a set of guidelines make sure customers are aware of potential water loss. Also, as part of these guidelines, District operators are sent out to help customers identify leaks and to investigate further conservation methods. Please see Appendix 4. From 2019 through 2023, District operators assisted 203 customers in tracking down leaks and other water loss preventing occurrences!

In March of 2017, the District completed its Backwash Recovery System. Previously all backwash and filter-to-waste flows were sent to the wastewater treatment facility for final disposal. Since 2019, a total of 75.716 MG has been recovered! Not only does this save source water but also greatly reduces the impact on the WWTP, including reducing electrical and chemical costs associated with its disposal. In fact, it reduces the necessity of pumping this water three times! Please see Appendix 5.

In conjunction with the installation of the backwash recovery system, a thorough examination of backwash procedures and treatment chemicals utilized were conducted. Through this the backwash produced has been reduced from roughly 36 MG per year down to almost 20 MG per year.

In addition to these large projects the District continues to periodically promote water conservation by sending out flyers, posts notices on the District's website, and maintaining signs informing of current watering schedules throughout the year. Customers are also encouraged to monitor their usage through Waterscope, the AMR's customer portal, and look for ways to conserve water and monitor irrigation cycles.

The District also maintains an increasing block rate structure to help curve water usage. In 2023, the District adopted as part of its updated Drought Contingency Plan, a mandatory no more than twice per week irrigation schedule on a year-round basis.

FIVE- AND TEN-YEAR CONSERVATION GOALS

The District recently completed an Effluent Line extension project that allows Hurst Creek MUD the ability to deliver Effluent to Lakeway MUD. This will allow the District's Effluent to be utilized wherever Lakeway MUD has disposal areas. During wet weather years, this will be highly beneficial to the District.

Five-year Goal – replace with effluent 10% of the lake water pumped to Hurst Creek for golf course irrigation. Using the numbers for 2023, for example, this effort would have conserved about 3.8 million gallons of Lake Travis water. On the treated water side, it would be difficult to improve on water accountability (which averages around 90% accountability), so our goal is to maintain this high level of accountability. Regarding per capita water use, the District proposes to reduce by 5% the annual use per connection, primarily via customer education and treatment facility efficiency. Maintain above 80% Backwash Recovery rate from recycled backwash water (recovered 89.23% in 2023).

Ten Year Goal – replace with effluent 25% of the lake water pumped to Hurst Creek for golf course irrigation. Based on 2023 numbers, this would conserve about 9.5 million gallons of Lake Travis water annually. Regarding treated water use, the District proposes to reduce by 10% the annual use per connection, again by customer education (encouraging customers to utilize Waterscope and monitor their usage) and treatment facility efficiency. Obtain a 90% Backwash Recovery rate from recycled backwash water.

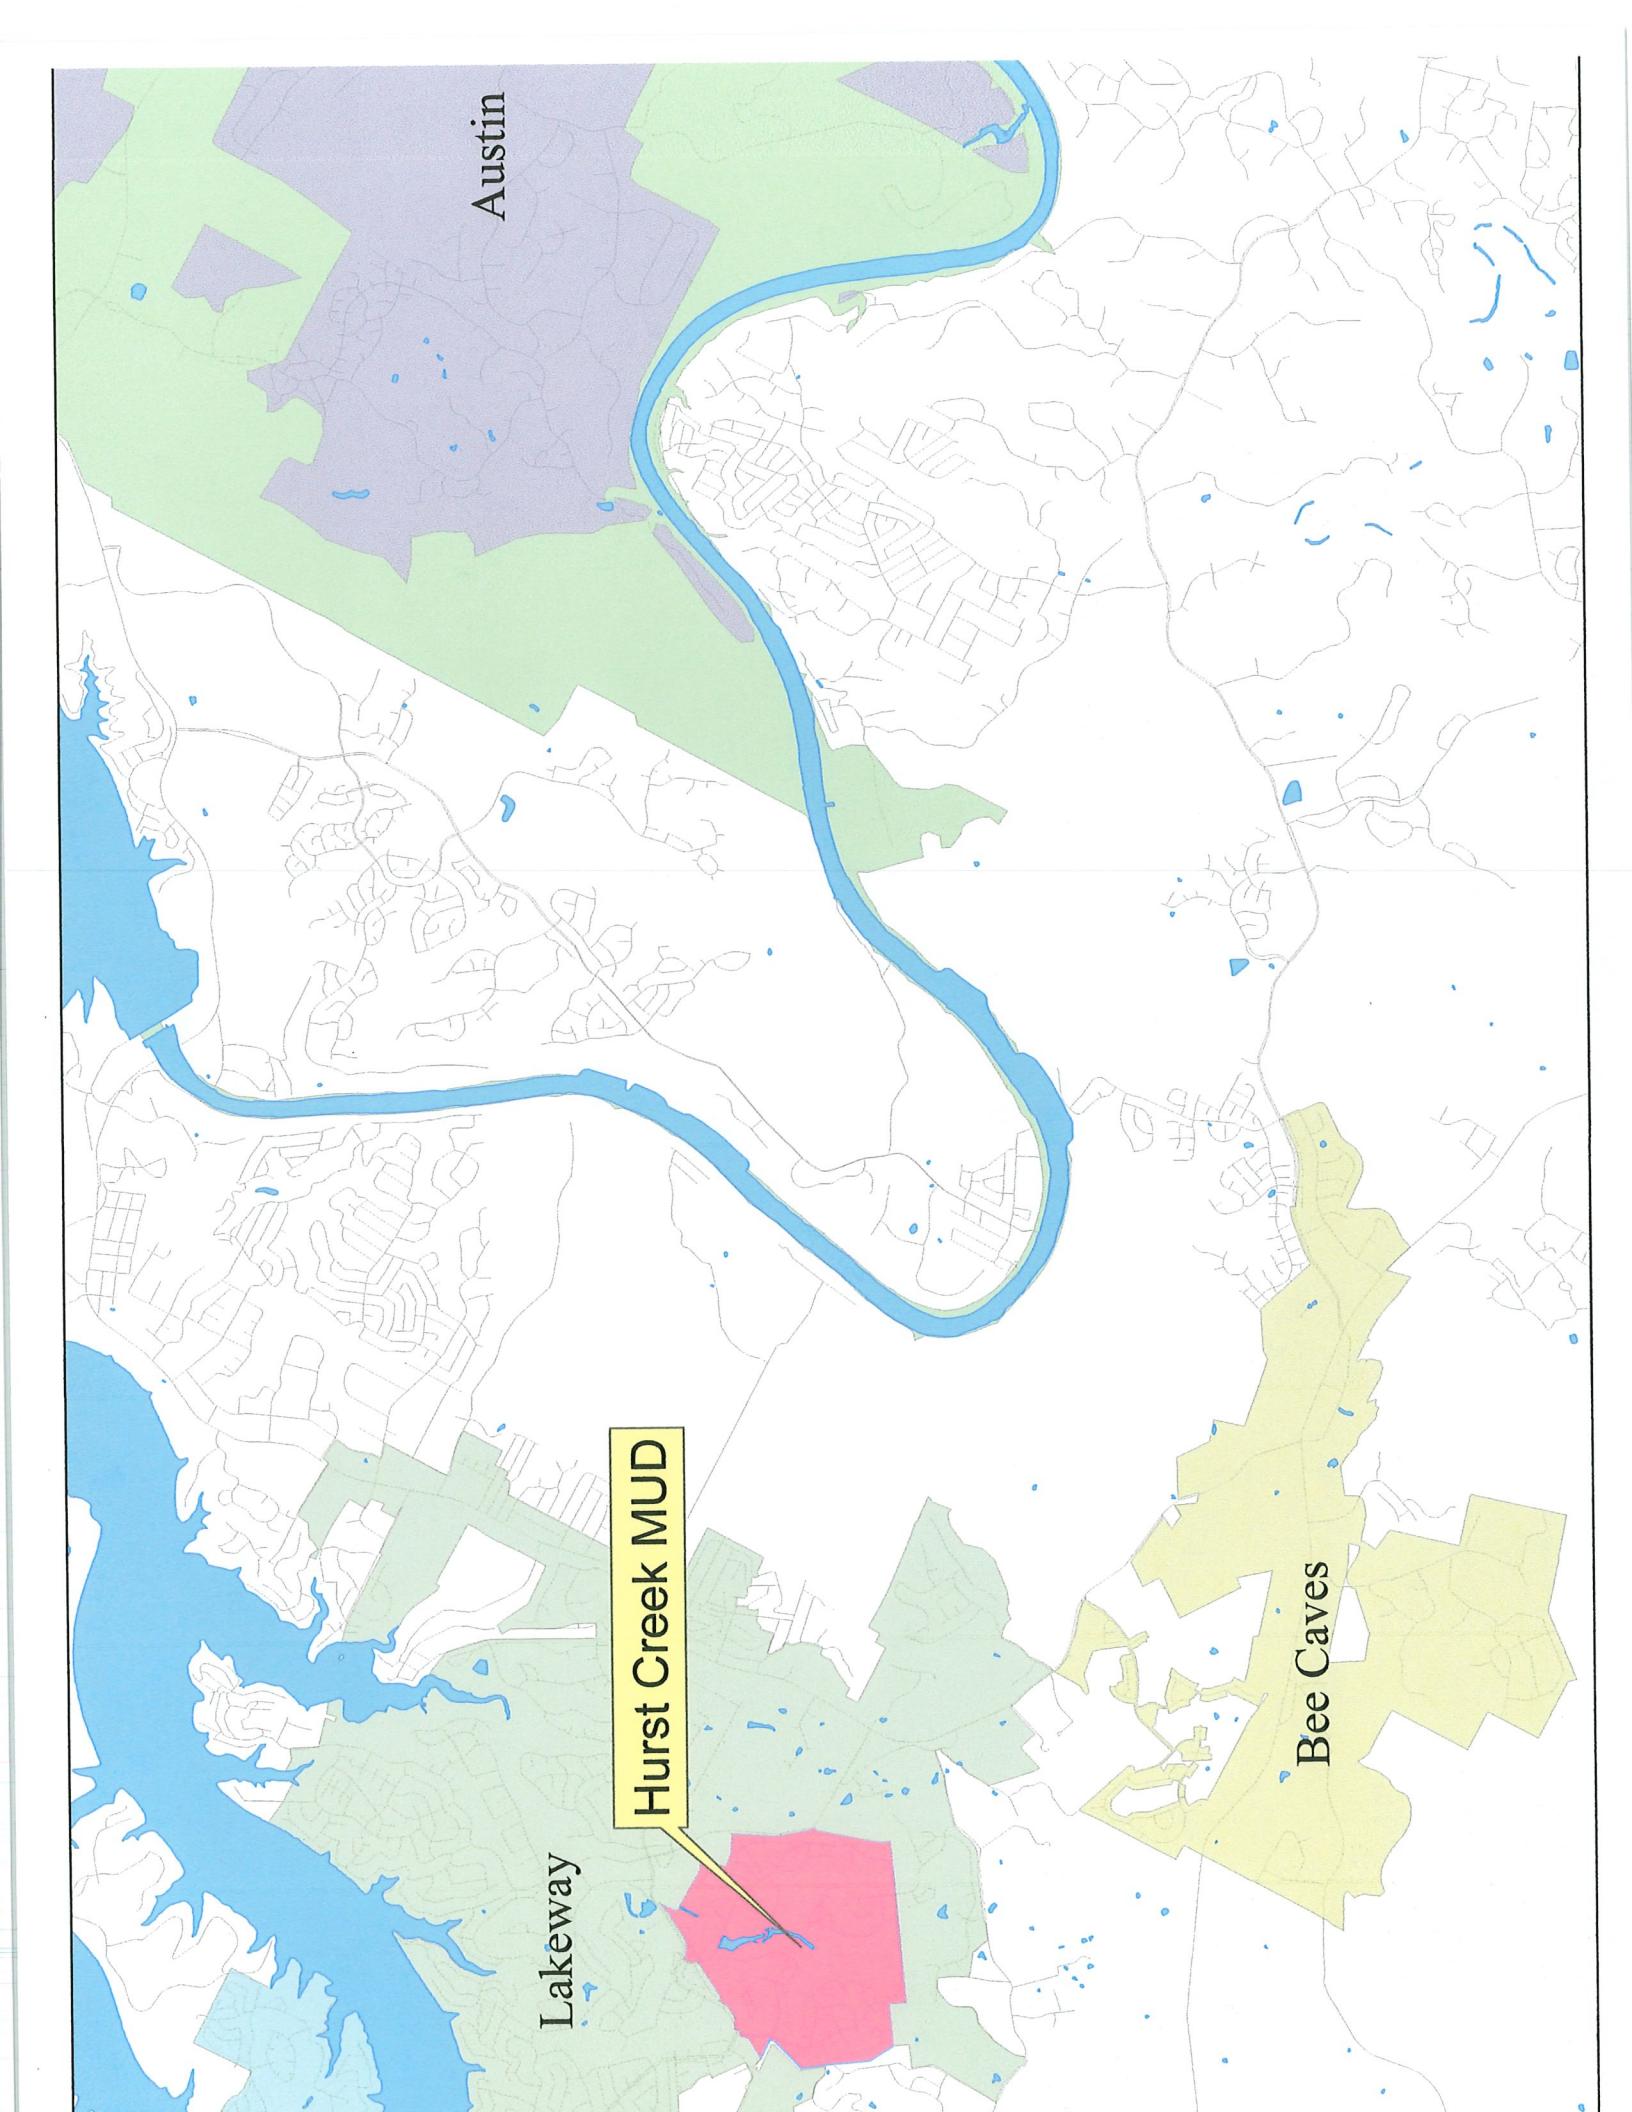

CONSERVATION PLAN IMPLEMENTATION

The Board of Directors will consider adopting this plan with a formal resolution (see appendix 6) and implement it through direction to the General Manager to initiate the necessary modifications to the effluent delivery facilities. Also, the District Manager will provide educational materials to customers urging water conservation in lawn watering.

REPORTING AND REVIEW

An annual report describing the implementation, status and effectiveness of the water conservation plan will be submitted to the Texas Water Development Board. The General Manager and District Engineer will review the plan annually and make recommendations to the District's Board of Directors for any necessary amendments or modifications.

RESOLUTION NO. 2024-01

A RESOLUTION OF THE BOARD OF DIRECTORS OF HURST CREEK
MUNICIPAL UTILITIES DISTRICT ADOPTING WATER CONSERVATION
PLAN

THE STATE OF TEXAS §
§
§
COUNTY OF TRAVIS §

WHEREAS, Hurst Creek Municipal Utility District owns and operates a public water system in Western Travis County, Texas, and

WHEREAS, the Texas Commission on Environmental Quality has mandated that certain public water systems formulate water conservation plans with attainable five- and ten-year goals, and

WHEREAS, the attached document “Hurst Creek Municipal Utility District Water Conservation Plan Five- and Ten-Year Goals” details the District’s historic water usage and provides for attainable and beneficial goals in water conservation;

NOW, THEREFORE, be it resolved by the Board of Directors of Hurst Creek Municipal Utilities District that the above-referenced document is hereby adopted as the District's official water conservation plan, and the General Manager is instructed to submit same in fulfillment of the TECQ requirements mandated in Title 30 of the Texas Administrative Code, Chapter 288.

APPROVED THIS 20TH DAY OF MAY 2024, IN A REGULAR MEETING OF THE
BOARD OF DIRECTORS OF HURST CREEK MUNICIPAL UTILITY DISTRICT.

ATTEST:

Mike Maroney
Secretary, Board of Directors

William A. Coskey
President, Board of Directors

William A. Coskey
President, Board of Directors
